Background

知識
工場

- **Knowledge Graph** exhibits its excellent performance through the intelligent applications built on it
- As typical AI systems, **Search engine** and **recommender system** are very popular and promising in the era of large data
- Many previous literatures and systems have proved KG's merits on such AI's applications

KG-based Search Engine

The History of Search Engine

- 1st: category-based
 - Yahoo, hao123
- 2nd: IR-based
 - Keyword-based, vector space, Boolean model
- 3rd: link-based
 - PageRank (Google)

result in

- The keyword of high click frequency are ranked higher
- The pages containing the keywords of more weights are ranked higher
- The pages having more important in-links are ranked higher

However, how to handle it
if users want to search something new or the ones of long tail?

The History of Search Engine

The History of Search Engine

- Search 4.0: user-based search engine
 - Really understand the search intent of users, especially for those rare entities
 - Directly return pure answers (entities) instead of relevant web pages
 - Provide plentiful/relevant results with high confidence/interpretability

intelligent search engine

It is actually a recommendation.

Knowledge graph can help the engine achieve these goals

Entity Suggestion with Conceptual Explanation [1]

知識
工場

- More than search

iPhone 6 Plus

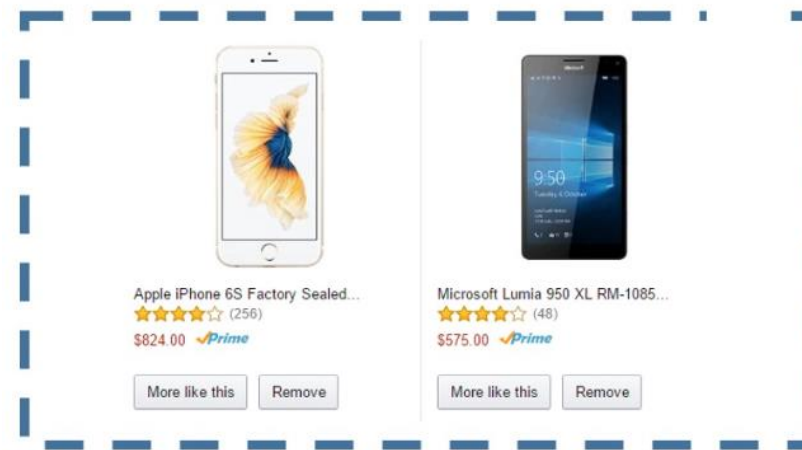

or

Your Recently Viewed Items

Query Examples

You May Also Like _____, Because _____

Suggested Entities

Can any search engine return such results?

- Problem statement
 - Given a query q described by a set of entities, the engine should return some **relevant** entities along with some **fine-grained** concepts which can well explain the results

Entity Suggestion with Conceptual Explanation

知識
工場

- What are the relevant entities and fine-grained concepts?

What entities should be suggested?

Chi

Entity Suggestion with Conceptual Explanation

- Previous Works
 - 1. Co-occurrence (text or query log), e.g. Google Set, Bayesian Set
 - 2. Web lists, e.g. SEAL, SEISA
 - 3. Overlap of properties
- Weakness
 - 1. Co-occurrence \neq conceptual coherence
 - 2. Membership of lists \rightarrow too general/specific concepts or a randomly combined list
 - 3. Overlap of properties \neq conceptual coherence

Entity Suggestion with Conceptual Explanation

知識
工場

- Solutions

1. Probabilistic Relevance Model

$$\operatorname{argmax}_{e \in E - q} rel(q, e) = \sum_i P(e|c_i)P(c_i|q)\delta(c_i)$$

Use **Probase** to find the relationships between concepts and entities

Find the best concepts which are **typical** and **fine-grained** to explain the suggested entities

2. Relative Entropy Model

$$\operatorname{argmin}_{e \in E - q} KL(P(C|q), P(C|q, e)) = \sum_{i=1}^n \delta(c_i)P(c_i|q)\log\left(\frac{P(c_i|q)}{P(c_i|q, e)}\right)$$

Entity Suggestion with Conceptual Explanation

- $P(c_i|q)$ Computation

1. Naïve Bayes Model

$$\begin{aligned} P(c_i|q) &= \frac{P(q|c_i)P(c_i)}{P(q)} \propto \prod_{e_j \in q} P(e_j|c_i)P(c_i) \\ &\propto P(c_i) \prod_{e_j \in q, n(e_j, c_i) > 0} \lambda P(e_j|c_i) \prod_{e_j \in q, n(e_j, c_i) = 0} (1 - \lambda)P(e_j) \end{aligned}$$

2. Noisy-or Model

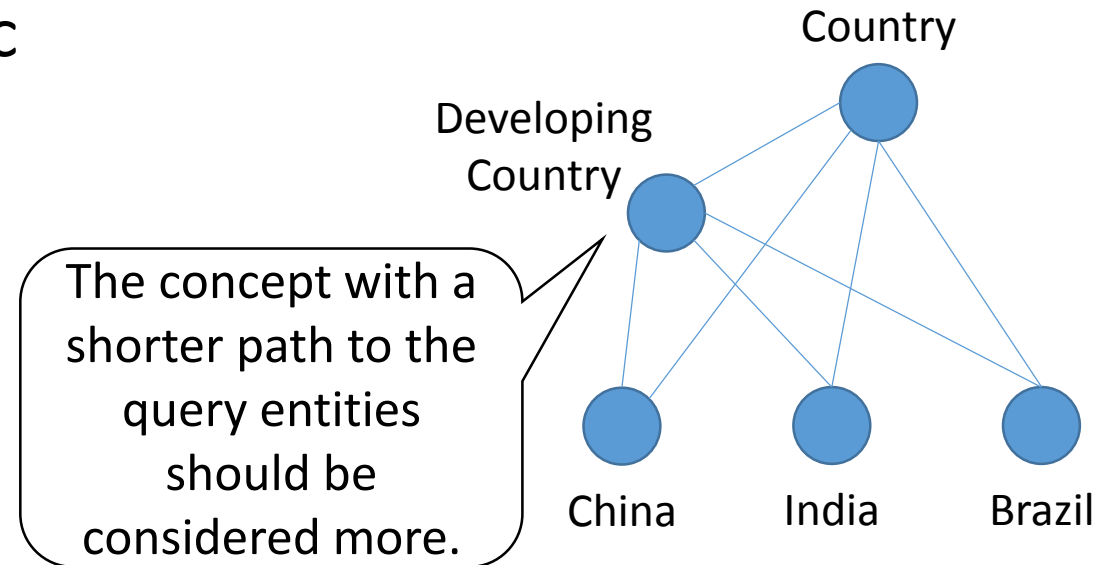

$$P(c_i|q) = 1 - \prod_{e_j \in q} (1 - P(c_i|e_j))$$

Entity Suggestion with Conceptual Explanation

- $\delta(c_i)$ computation
 - It quantifies the granularity of a concept, good concepts should not be too general or too specific

Concept	Number of Entities
Country	2648
Developing country	149
Growing market	18

Entity-based Approach

Hierarchy-based Approach

Entity Suggestion with Conceptual Explanation

- $\delta(c_i)$ computation

1. Entity-based Approach

- Penalize popular concepts

- $\delta(c_i) = \frac{1}{P(c_i)}$

2. Hierarchy-based Approach (Average first passage time)

- $\operatorname{argmax}_{c_q^k} \sum_{c \in C_q^k} \sum_{q_i \in q} h(q_i|c)$

- $$\begin{cases} h(q_i|c) = 0, & \text{if } q_i = c \\ h(q_i|c) = 1 + \sum_{c' \in C(c')} P(c'|q_i) h(c'|c) & \text{if } q_i \neq c \end{cases}$$

Long Concept Query using Conceptual Taxonomies [2]

- Problem statement
 - Given a long concept, the engine should return the correct entities belonging the concept
 - An example

American blind male musician

Long Concept Query using Conceptual Taxonomies

- A naïve solution
 - Divide the long concept
 - American blind male musician → {American musician, blind musician, male musician}
 - Challenge: Data Sparsity/Error by Hearst Patterns
 - For example:

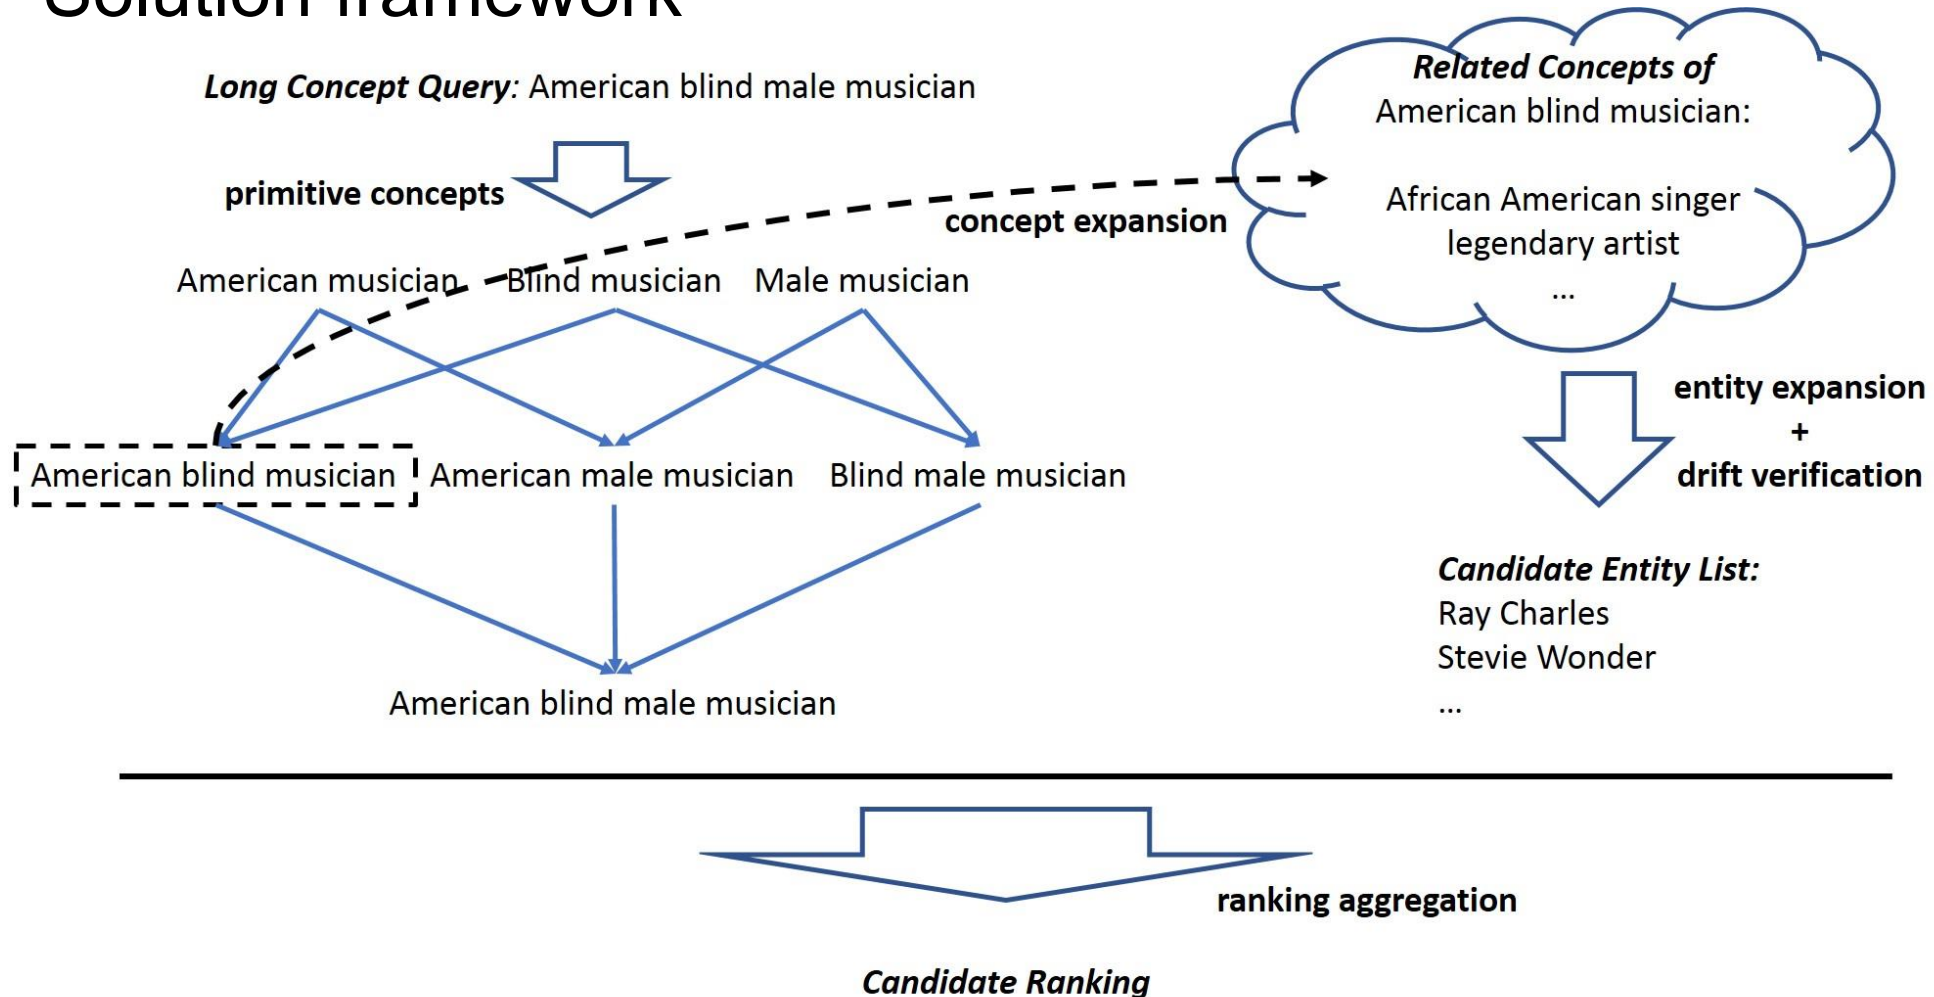

Concept	Entity
Blind musician	Ray Charles, Stevie Wonder, Kobzari, Jose Feliciano
Male musician	Vocalist, Jeffrey star, famous rock stars-guitarists, drummer

Finding right intersection is difficult

Long Concept Query using Conceptual Taxonomies

知識
工場

- Solution framework

KG-based Recommender Systems

Traditional Recommendation Algorithms

- Collaborative Filtering (CF) based
 - Use historical user-item interactions to describe the similarity between users/items, such as rating/purchase/review records...
- Content-based
 - Specify user/item's content by tags, text description/reviews, purchase records, social ties...
- Hybrid

However, how to handle the new users/items with sparse explicit data?

Cold Start is an inevitable problem!

KG-based Recommendation

知識
工場

Finding precise **relationships** between users and items is the ultimate goal in recommender systems

- When Knowledge Graph emerges
 - Understand and characterize users and items more comprehensively
 - Uncover the semantic/latent relationships between users and items other than the user-item interactions
 - Uncover the semantic/latent relationships between the features of users/items

What Knowledge Can be Used?

- Example1

- In KG, two movie/entity ‘警察故事’ and ‘十二生肖’ both have an attribute ‘主演：成龙’
- Such knowledge can be used to find the relationship/similarity between the two movies rather than those discovered based historical user-movie ratings

- Example2

- In a taxonomy KG, ‘华为Mate’ and ‘iPhone’ both ‘isA high-end business cellphone’, ‘荣耀’ and ‘小米’ both ‘isA low-end cellphone’
- Such knowledge can be used to infer the more precise characteristics of items

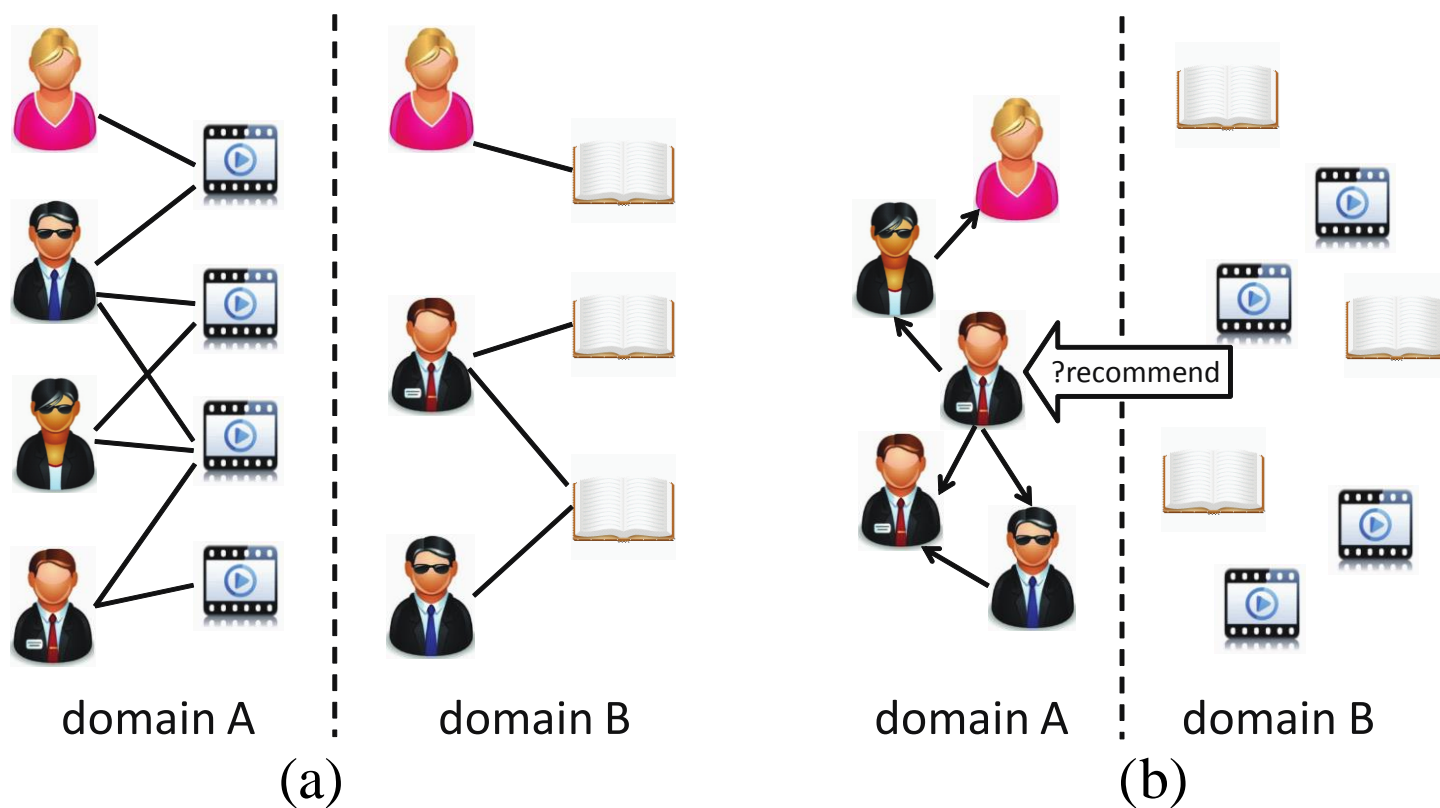

- Example3

- For tag-based recommenders, the semantic relationships between tags is very important, e.g., ‘摄影’ and ‘旅游’, which can be learned by KG

Semantic-based Recommendation across Heterogeneous Domains [3,4,5]

知識
工場

- Scenario of cross-domain recommendation

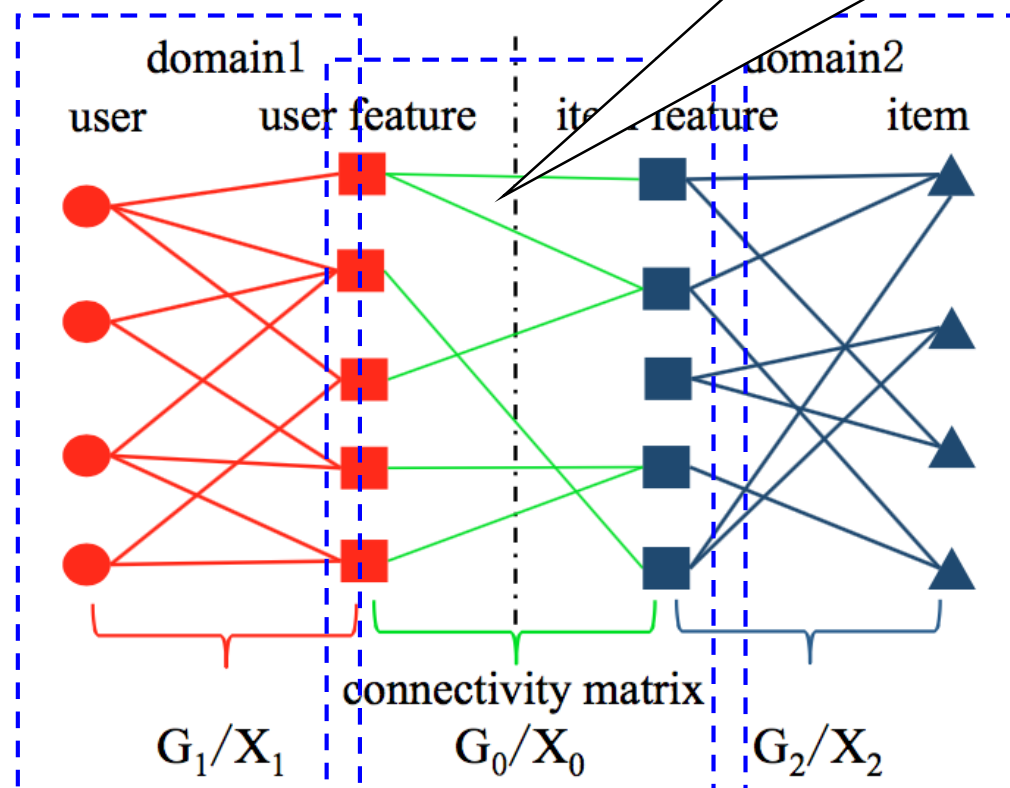

How to find the relationships between the users and items which are distributed in different domains?

Semantic-based Recommendation across Heterogeneous Domains

知識
工場

- Solution
 - A multi-partite graph based algorithm

Capturing the correlations between the features distributed in different domains is critical.

知識工場

- VS

Semantic-based Recommendation across Heterogeneous Domains

知識
工場

- ESA based semantic matching
